RESEARCH INTERESTS	<p>General relativity, numerical relativity simulations, black holes, gravitational waves, memory effects, the BMS group (and other symmetries of asymptotic infinity), ringdowns, surrogate models. Specifically, focusing on the improvement of waveform modeling for binary black hole mergers by matching the data of numerical simulations to that of analytic models using BMS frame fixing. Other interests include improving our understanding of black hole ringdowns and the way nonlinearities escape to infinity.</p>

TEACHING EXPERIENCE	<p>❑ TA for Ph205A (Quantum Field Theory) with Professor Sergei Gukov. California Institute of Technology.</p> <p>Pinned Review: “Perfect. Best TA I’ve ever seen, would be a phenomenal professor. Problem sets were difficult, and would have been demoralizing in the extreme without help in TA sessions. Especially remarkable was the fact that Keefe knew the material and the problems (as well as the solutions) absolutely inside and out, so no matter where I was stuck he immediately had a helpful suggestion. Plus, the TA demonstrated extensive knowledge of the material beyond the course itself, and could adroitly field questions related to current research and applications of QFT, recommend other texts that addressed the problems differently, or offer a different approach when (as was usually the case) the course text’s presentation was lacking.</p> <p>Extremely approachable and available outside of organized office hours – genuinely concerned about the students in the class.</p> <p>All things considered, HW troubles would have made this class an exceptionally unpleasant experience but for the excellent TA, thanks to whom I had a pretty good time overall.”</p>	<i>Sep. 2020 - Dec. 2020</i>
